Lemma

The permutations of $\{1, 2, \dots, k, k + 1\}$ ending in i that avoid 312 are precisely those of the form,

$$\pi_1 \pi_2 i$$

where π_1 and π_2 are permutations of $\{1, 2, \dots, i - 1\}$ and $\{i + 1, \dots, k + 1\}$ that avoid 312.

Theorem

The n^{th} term of the sequence $a_n(312)$ is equal to C_n , the n^{th} Catalan number, for $n > 0$.

Proof.

- Assume that for all i from 1 to k , the number of permutations of $\{1, 2, \dots, i\}$ that avoid 312 is C_i .

Proof.

- Assume that for all i from 1 to k , the number of permutations of $\{1, 2, \dots, i\}$ that avoid 312 is C_i .
- It follows from the above lemma that the total number of permutations π avoiding 312 and ending in i is

$$C_{i-1} \cdot C_{k-i+1}$$

Proof.

- Assume that for all i from 1 to k , the number of permutations of $\{1, 2, \dots, i\}$ that avoid 312 is C_i .
- It follows from the above lemma that the total number of permutations π avoiding 312 and ending in i is

$$C_{i-1} \cdot C_{k-i+1}$$

- Summing over all possible values of i , the total number of permutations of $\{1, 2, \dots, k+1\}$ that avoid 312 is equal to,

$$\sum_{i=1}^{k+1} C_{i-1} \cdot C_{k-i+1} = \sum_{i=0}^k C_i \cdot C_{k-i} = C_{k+1}$$

The Reversing Lemma

Definition (Reversing)

We define the *reverse* of a permutation $b_1 \cdots b_n$ to be the permutation $b_n \cdots b_1$. The reversing operator is denoted by \mathcal{R} .

The Reversing Lemma

Definition (Reversing)

We define the *reverse* of a permutation $b_1 \cdots b_n$ to be the permutation $b_n \cdots b_1$. The reversing operator is denoted by \mathcal{R} .

Example

$$\mathcal{R}(1324) = 4231.$$

Example

$$\mathcal{R}(1243) = 3421.$$

The Reversing Lemma

Lemma (Reversing Lemma)

The permutation σ avoids the permutation π iff $\mathcal{R}(\sigma)$ avoids $\mathcal{R}(\pi)$.

Corollary

For a permutation π , $a_n(\pi) = a_n(\mathcal{R}(\pi))$.

Definition (Flipping)

We define the *flip* of a sequence b as the sequence c with the same elements as b , but with the largest element swapped with the smallest element, the second largest element swapped with the second smallest element, etc. The flipping operator is denoted by \mathcal{F} .

The Flipping Lemma

Example

$$\mathcal{F}(1234) = 4321$$

The Flipping Lemma

Example

$$\mathcal{F}(1234) = 4321$$

Example

$$\mathcal{F}(1243) = 4312$$

$$\sigma = (14)(253)$$

$$\begin{aligned} &\{(34), (12), (1423), (1324)\}, \{(1243), (1342)\}, \\ &\{(24), (13), (1432), (1234)\}, \{(1)(2)(3)(4), (14)(23)\}, \\ &\{(142), (243), (123), (134)\}, \{(12)(34), (13)(24)\}, \\ &\{(143), (234), (132), (124)\}, \{(14), (23)\}. \end{aligned}$$

$$(a_n(\pi)) = \begin{cases} A := 1, 2, 6, 23, 103, 512, 2740, 15485, 91245 \dots \\ B := 1, 2, 6, 23, 103, 513, 2761, 15767, 94359 \dots \\ C := 1, 2, 6, 23, 103, 513, 2762, 15793, 94776 \dots \end{cases}$$

Cycle decomposition

$$(a_n(\pi)) = \begin{cases} A := 1, 2, 6, 23, 103, 512, 2740, 15485, 91245 \dots \\ B := 1, 2, 6, 23, 103, 513, 2761, 15767, 94359 \dots \\ C := 1, 2, 6, 23, 103, 513, 2762, 15793, 94776 \dots \end{cases}$$

B	A	C
$\{(34), (1423),$ $(12), (1324)\},$ $\{(24), (1432),$ $(13), (1234)\},$ $\{(12)(34), (13)(24)\},$ $\{(1)(2)(3)(4), (14)(23)\}$	$\{(142), (243),$ $(123), (134)\},$ $\{(143), (234),$ $(132), (124)\},$ $\{(1243), (1342)\}$	$\{(14), (23)\}$

Conjecture.

- There are three possible sequences for $(a_n(\pi))$.
- Given two F&R buckets that look the same up to the cycle decompositions of their elements, they generate the same sequence.

Definition

Let m be a positive integer. The set T_{2m} is defined as all permutations in S_{2m} such that:

- the odd numbers appear in increasing order,
- each even number $2i$ appears to the right of $2i - 1$.

Example

The set S_2 is $\{12, 21\}$. The set T_2 is just $\{12\}$.

Jain, Narayanan
and Zhang

1234	1243	1324	1342	1423	1432
2134	2143	2314	2341	2413	2431
3124	3142	3214	3241	3412	3421
4123	4132	4213	4231	4312	4321

Definition

Given a permutation $\pi \in S_k$, we define $b_m(\pi)$ as

$$b_m(\pi) = \#\{\sigma \in T_{2m} \mid \sigma \text{ avoids } \pi\}.$$

Problem

*Let $\pi \in S_3$, and m an arbitrary positive integer.
Compute $b_m(\pi)$.*

π	$m = 1$	$m = 2$	$m = 3$	$m = 4$	$m = 5$
123	1	0	0	0	0
132	1	1	1	1	1
213	1	2	4	8	16
231	1	2	4	8	16
312	1	3	12	55	273
321	1	3	12	55	273

Computing $b_m(123)$

π	$m = 1$	$m = 2$	$m = 3$	$m = 4$	$m = 5$
123	1	0	0	0	0
132	1	1	1	1	1
213	1	2	4	8	16
231	1	2	4	8	16
312	1	3	12	55	273
321	1	3	12	55	273

Pick any $\sigma \in T_{2m}$ with $m \geq 2$. Then:

- 3 comes after 1
- 4 comes after 3
- So 134 is a subsequence of σ .

Computing $b_m(132)$

π	$m = 1$	$m = 2$	$m = 3$	$m = 4$	$m = 5$
123	1	0	0	0	0
132	1	1	1	1	1
213	1	2	4	8	16
231	1	2	4	8	16
312	1	3	12	55	273
321	1	3	12	55	273

Let $m \geq 2$, and pick any $\sigma \in T_{2m}$ avoiding 132. Then:

- 1 always comes first
- Each even integer $2i$ must come before $2i + 1$
- So σ must be $1234 \dots (2m)$.
